Client's ref.: 910014us

Our ref: 0746-8151-USf/dennis/kevin

What is claimed is:

7.

11.

- 1. A plug detection circuit, disposed in a electronics device with an earphone jack, wherein the earphone jack has a first pin and a second pin, the detection circuit comprising:
 - a first detection circuit electrically coupled to
 the first pin to output a first logic potential
 when the earphone plug is electrically coupled
 to the first pin of the earphone jack; and
 - a second detection circuit electrically coupled to
 the second pin to output a second logic
 potential when the earphone plug is
 electrically coupled to the second pin of the
 earphone jack;
 - wherein the presence of microphone function in the connected earphone is detected according to the first logic potential and the second logic potential.
 - 2. The plug detection circuit as claimed in claim 1, wherein the first and second logic potentials are low when no plug is connected to the earphone jack.
 - 3. The plug detection circuit as claimed in claim 1, wherein the first and second logic potentials are high when the earphone plug plugged in the earphone jack is of a typical earphone.
 - 4. The plug detection circuit as claimed in claim 1, wherein the first logic potential is high and the

6.

11 .

second logic potential is low when a plug of an earphone with a microphone function is connected.

- 5. The plug detection circuit as claimed in claim 1, wherein the plug further has a grounded conductive ring and the earphone jack further has a third pin, the grounded conductive ring and the third pin are coupled to ground together when the plug is connected to the earphone jack.
- 6. A plug detection circuit, disposed in a electronics device with an earphone jack, wherein the earphone jack has at least a first pin, a second pin and a third pin, the detection circuit comprising:
 - a first resistor electrically coupled to a voltage source and the first pin respectively;
 - a second resistor electrically coupled to the first pin;
 - a first capacitor having one end electrically coupled to a first output terminal with the second resistor, and the other end coupled to ground, wherein the potential at the first output terminal is a first logic potential;
 - a third resistor having one end electrically coupled to the third pin;
 - a fourth resistor electrically coupled to the voltage source and the second pin respectively;
- a fifth resistor having one end electrically coupled to the second pin;

4.

Our ref: 0746-8151-USf/dennis/kevin

- a second capacitor having one end electrically coupled to the fifth resistor, and the other end coupled to ground;
 - a sixth resistor having one end electrically coupled to the voltage source; and
 - a switch having one end electrically coupled to the sixth resistor, and the other end coupled to ground, wherein the switch further has a control terminal electrically coupled to a second output terminal with the second capacitor and the fifth resistor, and the potential at the second output terminal is a second logic potential.
 - 7. The plug detection circuit as claimed in claim 6, wherein the first pin is electrically coupled to the third pin and the switch is turned on when no plug is connected to the earphone jack, and the first logic potential and the second logic potential are low.
 - 8. The plug detection circuit as claimed in claim 6, wherein the plug connected is of a typical earphone with a first conductive ring and a grounding ring; the second pin, the first conductive ring and the ground ring are electrically coupled to ground together, the first pin is not electrically coupled to the third pin, and the switch is turned off when the plug is connected to the earphone jack; and the first logic potential and the second potential are both high.

Client's ref.: 910014us Our ref: 0746-8151-USf/dennis/kevin

9. The plug detection circuit as claimed in claim 6, wherein the plug connected to the earphone jack is of an earphone with microphone function and has a first conductive ring, a second conductive ring and a grounding ring; the first conductive ring is electrically coupled to the grounding ring, the second conductive ring is electrically coupled to the second pin, the first pin is not electrically coupled to the third pin, and the switch is turned on when the plug is connected to the earphone jack; and the first logic potential is high and the second potential is low.
